Medical Statistics: Clinical Trials
Medical Statistics: Survival Analysis

97

- **Parametric Models**
 - ♦ Estimate unknown parameters by maximum likelihood
- **Exponential**
 - ♦ $f(t) = \lambda e^{-t}$ ($t > 0$)
 - ♦ $S(t) = e^{-\lambda t}$ ($= 1 - F(t) = 1 - (1 - e^{-\lambda t})$)
 - ♦ $h(t) = \lambda$

©NRJF, University of Sheffield, 2011/12, Semester 1

Medical Statistics: Survival Analysis

98

- **Uncensored data**
 - ♦ Observe t_1, t_2, \dots, t_n
 - ♦ $Lik(\lambda; t_1, t_2, \dots, t_n) = L(\lambda) = \prod f(t_i) = \lambda^n e^{-\lambda \sum_{i=1}^n t_i}$
 - ♦ $Log_e(L) = \ell(\lambda) = n \log(\lambda) - \lambda \sum t_i$

$$\Rightarrow \hat{\lambda} = \frac{n}{\sum_{i=1}^n t_i}$$

©NRJF, University of Sheffield, 2011/12, Semester 1

Medical Statistics: Survival Analysis

99

- ♦ Confidence interval from result that $\sum_{i=1}^n T_i \sim \Gamma(n, \lambda)$
 - (note chi-squared is special case of gamma)

$$\left(\frac{\chi_{2n, \alpha/2}^2}{2 \sum t_i}, \frac{\chi_{2n, 1-\alpha/2}^2}{2 \sum t_i} \right)$$

©NRJF, University of Sheffield, 2011/12, Semester 1

Medical Statistics: Survival Analysis

100

- Also have MLEs of any other function, e.g. survival function

$$\hat{S}(t) = e^{-\hat{\lambda}t}$$

e.g. median survival time \tilde{t}

$$S(\tilde{t}) = 0.5 \Rightarrow \tilde{t} = -\lambda^{-1} \log(0.5)$$

$$\hat{\tilde{t}} = -\hat{\lambda}^{-1} \log(0.5)$$

©NRJF, University of Sheffield, 2011/12, Semester 1

Medical Statistics: Survival Analysis

101

- **Censored Data**
 - ♦ 'Time' censored, n patients,
 - potential lifetimes $T_i \sim \text{Ex}(\lambda)$
 - observe **either** complete lifetime t_i or that $T_i > c_i$, ($i=1, 2, \dots, n$).
 - ♦ Contributions to likelihood:
 - " $P[T_i = t_i]$ " = $\lambda e^{-\lambda t_i}$ (if $t_i \leq c_i$)
 - " $P[T_i > c_i]$ " = $e^{-\lambda c_i}$ (if $t_i > c_i$)

©NRJF, University of Sheffield, 2011/12, Semester 1

Medical Statistics: Survival Analysis

102

Define $\delta_i=1$ if $t_i \leq c_i$ (uncensored)
 $\delta_i=0$ if $t_i > c_i$ (censored)

Then likelihood $L(\lambda) = \prod_{i=1}^n [\lambda e^{-\lambda t_i}]^{\delta_i} [e^{-\lambda c_i}]^{1-\delta_i}$

$$\Rightarrow \hat{\lambda} = \frac{\sum_{i=1}^n \delta_i}{\sum_{i=1}^n \{\delta_i t_i + (1 - \delta_i) c_i\}}$$

©NRJF, University of Sheffield, 2011/12, Semester 1 Medical Statistics: Survival Analysis 103

$$\hat{\lambda} = \frac{\text{total number of deaths observed}}{\text{total time alive of all patients in the study}}$$

holds for censored and uncensored cases

©NRJF, University of Sheffield, 2011/12, Semester 1 Medical Statistics: Survival Analysis 104

- Distribution of $\hat{\lambda}$ not easy
 - (not based on simple sum of exponentials)
 - Use general theory of MLE for approximate formula :

$$\text{var}(\hat{\lambda}) \approx \frac{\hat{\lambda}^2}{\sum_{i=1}^n (1 - e^{-\hat{\lambda} c_i})}$$

$$\text{var}(\hat{\lambda}) \approx \frac{\hat{\lambda}^2}{\sum_{i=1}^n \delta_i} \quad \text{numerically same [almost]}$$

©NRJF, University of Sheffield, 2011/12, Semester 1 Medical Statistics: Survival Analysis 105

- $100(1 - \alpha)\%$ Confidence Interval for λ is

$$\hat{\lambda} \pm z_{1-\alpha/2} \times \text{s.e.}(\hat{\lambda})$$

Where $\text{s.e.}(\hat{\lambda}) = \sqrt{\text{var}(\hat{\lambda})}$

©NRJF, University of Sheffield, 2011/12, Semester 1 Medical Statistics: Survival Analysis 106

- Note use of formula

$$\text{var}\{g(\hat{\lambda})\} \approx \left[\frac{d}{d\lambda} g(\lambda) \right]_{\lambda=\hat{\lambda}}^2 \text{var}(\hat{\lambda})$$

for finding CIs of functions $g(\lambda)$ of λ
 e.g. $\mu = \lambda^{-1} = E[T]$ the mean lifetime
 $g(\lambda) = \lambda^{-1}$ so $g'(\lambda) = -\lambda^{-2} = -\mu^2$ so

$$\text{var}(\hat{\mu}) \approx \frac{\hat{\mu}^2}{\sum_{i=1}^n (1 - e^{-c_i/\hat{\mu}})} \quad \text{or} \quad \text{var}(\hat{\mu}) \approx \frac{\hat{\mu}^2}{\sum_{i=1}^n \delta_i}$$

©NRJF, University of Sheffield, 2011/12, Semester 1 Medical Statistics: Survival Analysis 107

- Example

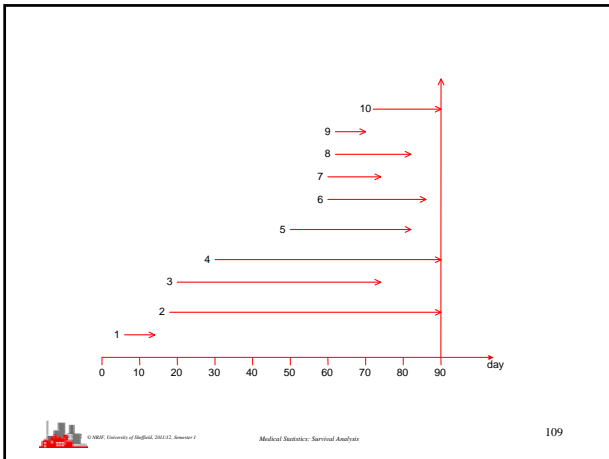

- ♦ 10 patients, 3 censored (2nd, 4th & 10th)

| Patient no. | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|---------------------|----|----|----|----|----|----|----|----|----|----|
| Entry time | 9 | 18 | 20 | 30 | 49 | 59 | 59 | 60 | 61 | 69 |
| Survival time t_i | 2 | . | 51 | . | 33 | 27 | 14 | 24 | 4 | . |
| max possible c_i | 81 | 72 | 70 | 60 | 41 | 31 | 31 | 30 | 29 | 21 |
| δ_i | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 0 |

©NRJF, University of Sheffield, 2011/12, Semester 1 Medical Statistics: Survival Analysis 108

- Thus $\sum \delta_i = 7$ deaths on study.
 $\sum \delta_i t_i = 155$, $\sum (1-\delta_i) c_i = 153$
 $\hat{\lambda} = \frac{7}{308} = 0.023$ per day
 $\hat{\mu} = \frac{308}{7} = 44.0$ days
 confidence intervals etc from formula

- data $\{(t_i, \delta_i); i=1, \dots, n\}$
 - $\delta_i = 1$ if death occurred, 0 if censored
$$L(\theta) = \prod_{\text{deaths}} f(t_i) \prod_{\text{censored}} S(t_i)$$

$$= \prod_{\text{deaths}} h(t_i) S(t_i) \prod_{\text{censored}} S(t_i)$$

$$= \prod_{i=1}^n [h(t_i)]^{\delta_i} S(t_i)$$

- This general formula holds for all distributions (lognormal, Weibull, gamma, Gumbel,.....)
- All require numerical estimation
 - Minitab, SPSS, S-PLUS

- Summary**
 - Life tables
 - Grouped data
 - Allow for censoring by adjusting # at risk
 - Kaplan-Meier
 - Individual data
 - Uncensored case = 1 - empirical CDF
 - Express as a product of terms $[1 - d_i/r_i]$
 - Censored case by adjusting # at risk

- Kaplan-Meier estimates are the key exploratory tool for censored data
 - Cannot draw histograms of censored data
 - Don't know which bin to put a censored in
- Kaplan-Meier Plot is always step 1 in analysing censored data

- Parametric models
 - ◆ Estimate parameters by MLE
 - ◆ Uncensored observations contribute $f(t_i)$ &
 - ◆ Censored contribute $S(t_i)$ to likelihood
 - ◆ Use MLE theory for standard errors
 - ◆ Plug in MLEs for other functions of θ
 - ◆ Use formula for s.e.[$g(\theta)$]
